Empirical Proof Record — VALIDATED

Proof ID: 3e27e5fb8ab610a1d6c20d7d94cf856c...

Created: 2026-05-31T18:33:53.589010+00:00

1. Claim

Two independent invocations of the 'crdt-laws' scenario with constructor kwargs {'n_sequences': 5, 'ops_per_sequence': 5, 'seed': 20260517} produce bit-identical reproducibility-form proof hashes. (RFC 0002 Phase E4: research-grade reproducibility — every scenario must be deterministic given a fixed seed + corpus + substate_commit + ophamin_commit.)

- **Operationalisation:** Instantiate the target scenario twice with identical kwargs; run each to emit a signed proof record; compute reproducibility_hash(proof) on each (SHA-256 over the canonical body with wall-clock fields stripped); assert the two hashes match exactly.
- **Threshold:** reproducibility_hash_match >= 1.0 proportion
- **H0:** Two independent runs of the target scenario produce different reproducibility-form hashes — non-determinism is leaking somewhere in the measurement pipeline.
- **H1:** Two independent runs produce bit-identical reproducibility-form hashes — the scenario honours the seed + config contract.

2. Verdict

VALIDATED — observed 1.0

match: reproducibility_hash_a=d6f1467412f029b3..., reproducibility_hash_b=d6f1467412f029b3...
— target scenario was 'crdt-laws'

3. Evidence

Pillar	Statistic	Value	95% CI	Library
reproducibility_audit	reproducibility_hash_match	1.0	—	ophamin 0.115.2

4. Pre-registration
