Empirical Proof Record — VALIDATED

Proof ID: 31f3dced6479b557c45d8950f2fb2bbd...

Created: 2026-05-24T20:12:56.297179+00:00

1. Claim

A default Takwin() with NO seed and no flags bootstraps its own learned geoid manifold from its OWN lived cloud at the first rich consolidation (cold N=5 $\rightarrow$ learned-N, no seed) and grows it as experience accumulates, with the cycle staying coherent (post-bootstrap mean $\Phi \geq 0.5$). Nothing is imposed; dynamic-N is mandatory and intrinsic.

- **Operationalisation:** Default Takwin() (cold N=5 hash, `_use_learned_geoid=False`) $\rightarrow$ stream of accumulating experience $\rightarrow$ `_refit_geoid_dimension` fires at consolidation, bootstrapping the first learned manifold from the lived `_geoid_map` cloud; observed = post-bootstrap mean Φ , gated on bootstrapped (cold $\rightarrow$ learned) AND N grew.
- **Threshold:** `post_bootstrap_mean_phi` ≥ 0.5 `phi`
- **H0:** H0: no cold-start bootstrap, or post-bootstrap $\Phi < 0.5$ — seedless dynamic-N not viable
- **H1:** H1: bootstrapped from cold (no seed) and post- $\Phi \geq 0.50$ — nothing imposed

2. Verdict

VALIDATED — observed 0.7262

cold start N=5 (`learned=False`); bootstrapped at cycle 4 $\rightarrow$ learned-N from the substrate's OWN cloud (no seed); grew to N=91 (4 grows); post-bootstrap mean Φ 0.726 (min 0.692) — coherent through the bootstrap. Nothing imposed; mandatory, intrinsic dynamic-N.

Figure 1: `post_bootstrap_mean_phi` – observed value with Wilson 95% CI.

3. Evidence

Pillar	Statistic	Value	95% CI	Library
seedless_self_dimensioning	<code>post_bootstrap_mean_phi</code>	0.7262	(0.0000, 0.0000)	numpy 2.4.4
