Empirical Proof Record — INCONCLUSIVE

Proof ID: 079b4abd6dacc94581af28ce46db6327...

Created: 2026-05-24T03:31:26.445847+00:00

1. Claim

Kimera's semantic manifold stays a single connected component under exposure — the median β (zeroth Betti number, count of connected components) over GWF-cleared cycles equals 1.

- **Operationalisation:** median of β across GWF-cleared cycles for which the substrate exposes a topology measurement
- **Threshold:** `manifold_betti_0_median == 1.0 count`
- **H0:** median $\beta \neq 1$ (manifold fragmented or degenerate)
- **H1:** median $\beta == 1$ (manifold connected)

2. Verdict

INCONCLUSIVE — observed 0.0

manifold topology measured on 0/40 GWF-cleared cycles; median $\beta = 0$ (connected-component rate 0.0%); median $\beta = 0$, median $\beta = 0$; geoid graph up to 0 nodes / 0 edges; 0 adapter errors; too few cycles exposed a topology measurement to decide (substrate may not surface β -numbers in this build)

3. Evidence

Pillar	Statistic	Value	95% CI	Library
0.topology.manifold_betti_0	manifold_betti_0_median	0.0	—	ophamin 0.1.0
0.topology.manifold_betti_1	manifold_betti_1_median	0.0	—	ophamin 0.1.0
0.topology.manifold_betti_2	manifold_betti_2_median	0.0	—	ophamin 0.1.0
0.topology.geoid_graph	geoid_graph_nodes_max	0.0	—	ophamin 0.1.0
