Empirical Proof Record — **INCONCLUSIVE**

Proof ID: 65887699c12d3ab5fadf05fd094b99ce...

Created: 2026-05-22T16:57:12.463256+00:00

1. Claim

A partial cue of a SEEN experience recalls its full content better than a partial cue of a never-seen item: $\text{memory_lift} = \text{mean}(\text{recall}|\text{seen}) - \text{mean}(\text{recall}|\text{never-seen}) > 0$. Both arms get the same impoverished cue, so this isolates path-dependent memory from deterministic re-derivation.

- **Operationalisation:** Stream 80 seen items; never stream 25 control items. Probe partial cues (first 15% of words) of 25 seen and 25 control items. $\text{recall} = \text{Jaccard}(\text{concepts}(\text{partial cue}), \text{concepts}(\text{full item}))$. $\text{memory_lift} = \text{mean}(\text{recall}|\text{seen}) - \text{mean}(\text{recall}|\text{control})$; decided VALIDATED iff $\text{lift} > 0$ with a significant seen>control Mann-Whitney.
- **Threshold:** $\text{memory_lift} > 0.0 \text{ jaccard}$
- **H0:** H0: $\text{memory_lift} \leq 0$ — a seen partial cue recalls no better than a never-seen one; 'recall' is deterministic re-derivation
- **H1:** H1: $\text{memory_lift} > 0$ — prior exposure completes the partial cue; path-dependent memory beyond re-derivation

2. Verdict

INCONCLUSIVE — observed -0.08073282185995534

$\text{memory_lift} -0.0807 = \text{seen recall } 0.2698 \text{ (n=21)} - \text{control recall } 0.3505 \text{ (n=25)}$; partial cue = first 15% of words; seen>control Mann-Whitney $p=0.52$ (NOT significant); INCONCLUSIVE — lift not statistically significant

3. Evidence

Pillar	Statistic	Value	95% CI	Library
0.flow.cued_recall	memory_lift	-0.08073282185995534	—	ophamin 0.108.0
