Empirical Proof Record — INCONCLUSIVE

Proof ID: 50e3027f17cba984c9f20d34634895aa...

Created: 2026-05-24T03:30:04.455933+00:00

1. Claim

Across a long single-pass stream, the substrate still recalls earlier experiences beyond a fixed context window: (for every probe whose lag exceeds `window_ref=256`, recall Jaccard ≥ 0.50). The reported floor is the worst beyond-window probe.

- **Operationalisation:** Stream 8 distinct stimuli once through Kimera's entity target, then re-probe 8 positions spread over the stream. For each probe, `recall = Jaccard(concept set at first exposure, concept set at probe)`; `lag = intervening cycles`. `recall_floor_beyond_window = min recall over probes with lag > 256`; the invariant holds iff that floor ≥ 0.50 .
- **Threshold:** `recall_floor_beyond_window >= 0.5 jaccard`
- **H0:** H0: `recall < 0.50` for some item recalled beyond `window_ref=256` — the horizon is shorter than the reference window
- **H1:** H1: `recall  $\geq 0.50$` for every beyond-window probe — memory reaches past a fixed window of that size

2. Verdict

INCONCLUSIVE — observed 0.0

recall floor 0.0000 over 0 beyond-window probes (lag > 256); mean recall 0.0000, stdev 0.0000; memory horizon (max lag with recall ≥ 0.50) = 8 cycles; max lag measured 8; 8-item single-pass stream; 0 probes produced no concept set; too few beyond-window probes (<3) to decide — widen the stream or lower `window_ref`

3. Evidence

Pillar	Statistic	Value	95% CI	Library
0.flow.memory_horizon	recall_floor_beyond_window	0.0	—	ophamin 0.115.2
