Empirical Proof Record — **REFUTED**

Proof ID: f295557437040044148de44cb6cb5b47...

Created: 2026-05-24T03:32:08.141870+00:00

1. Claim

At least 80% of the always-on numeric signals Kimera emits (those present in EVERY cycle) carry real dynamics (vary with the stimulus) rather than emitting a frozen default constant.

- **Operationalisation:** Stream 40 diverse records from the 'flores' corpus through the Kimera 'entity' target; collect every finite numeric leaf in CycleResult.raw per cycle. Restrict to ALWAYS-ON signals (present in all cycles $\rightarrow$ zero sampling doubt); a signal is LIVE if it takes ≥ 2 distinct values, FROZEN if constant. $\text{liveness_rate} = \text{always_on_live} / \text{always_on_total}$. Under-sampled signals are excluded (a signal seen in few cycles is trivially constant — not a frozen default).
- **Threshold:** $\text{liveness_rate} \geq 0.8$ proportion
- **H0:** H0: $\text{liveness} < 80\%$ — most emitted signals are frozen defaults; the body is structurally wired but not dynamically alive; the frozen worklist is non-empty
- **H1:** H1: $\text{liveness} \geq 80\%$ — the emitted signal surface is dynamically alive

2. Verdict

REFUTED — observed 0.6642246642246642

always-on liveness 0.6642: 544/819 every-cycle signals carry real dynamics; 275 are frozen defaults (the worklist); Wilson 95% CI [0.6312, 0.6957]. Context: whole-surface 2234/10370 (0.2154, deflated by under-sampling); 40 cycles

Figure 1: liveness_rate – observed value with Wilson 95% CI.

3. Evidence

Pillar	Statistic	Value	95% CI	Library
signal_dynamics	liveness_rate	0.6642246642246642	(0.6312, 0.6957)	statsmodels 0.14.6
