1. Claim

When fed text describing Kimera's own primitives, the substrate's dissonance signal (`dissonance_events_count`) is measurably higher than on neutral text — Cohen's d effect size ≥ 0.30 (one-sided, self-referential $>$ neutral). A REFUTED verdict means the substrate does not differentially process content about itself.

- **Operationalisation:** Cohen's d effect size on per-cycle `dissonance_events_count` between the self-referential group and the neutral group (pooled-variance form, one-sided)
- **Threshold:** `dissonance_cohens_d_self_ref_vs_neutral` ≥ 0.3 `cohens_d`
- **H0:** Cohen's $d < 0.30$ (substrate does not differentiate self-referential content)
- **H1:** Cohen's $d \geq 0.30$ (substrate differentially processes content about itself)

2. Verdict

REFUTED — observed -0.35857771704220054

Cohen's d (`self_ref` - `neutral`)/`pooled_sd` = -0.359; `self_ref` dissonance: $n=30$ median=17.0 mean=17.37 (range 0-29); `neutral` dissonance: $n=30$ median=20.0 mean=20.73 (range 0-45); Mann-Whitney $U=323.0$, one-sided $p=0.9705$; 60 cycles, 0 adapter errors

3. Evidence

Pillar	Statistic	
0.philosophical.cohens_d	dissonance_cohens_d_self_ref_vs_neutral	-0.358577717
0.philosophical.mannwhitneyu	dissonance_mannwhitneyu_p_value	0.97053339
