1. Claim

Across every Python module in Kimera-SWM's interface stratum (REST routers + controllers, GraphQL surface, MCP tools, CLI commands, WebSocket handlers), at least 95% are structurally intact (parse cleanly AND declare at least one externally-callable handler).

- **Operationalisation:** $\text{contract_compliance_rate} = (\text{parses_ok AND (has_handler_def OR has_handler_decorator)}) / \text{total_interface_modules}$. `ast.parse` run on each module; decorators matched against a known handler-name allowlist (FastAPI verbs, Click commands, MCP tool/resource/prompt, etc.).
- **Threshold:** $\text{contract_compliance_rate} \geq 0.95$ proportion
- **H0:** H0: structural breakage exceeds 5% — the interface contract is unstable at this Kimera commit
- **H1:** H1: structural breakage is $\leq 5\%$ — the interface contract holds at this Kimera commit

2. Verdict

VALIDATED — observed 0.98

98/100 interface-stratum modules are contract-compliant (0.9800); Wilson 95% CI [0.9300, 0.9945]

3. Evidence

Pillar	Statistic	Value	95% CI	Library
static_ast_parse	contract_compliance_rate	0.98	(0.9300, 0.9945)	statsmodels 0.14.6

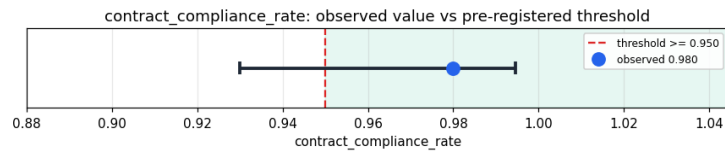

Figure 1: contract_compliance_rate – observed value with Wilson 95% CI.
