1. Claim

Across all 9 KimeraInventory strata, the aggregate orphan rate is $\leq 20.0\%$. An orphan is a Python module in the inventory that has zero incoming imports from any other file in the Kimera repo AND is not explicitly annotated as WIRE_CANDIDATE / WIRED / ARCHIVED.

- **Operationalisation:** Build an import graph by walking every .py file under kimera_swm/ and parsing “import” / “from ... import” statements. For each inventoried surface, count incoming edges. Combine with annotation scanning (“.. note:: WIRE_CANDIDATE“ etc.) to produce one of {wired, wire_candidate, orphan, archived, parse_error, config}. $orphan_rate = n_orphan / n_total_python_surfaces$.
- **Threshold:** $aggregate_orphan_rate \leq 0.2$ proportion
- **H0:** H0: orphan rate $> 20.0\%$ — load-bearing infrastructure is sitting unwired; fix list is non-empty
- **H1:** H1: orphan rate $\leq 20.0\%$ — substrate completeness within target band

2. Verdict

VALIDATED — observed 0.08

26/325 surfaces classified orphan (0.0800); Wilson 95% CI [0.0552, 0.1146]

3. Evidence

Pillar	Statistic	Value	95% CI	Library
import_graph_static	aggregate_orphan_rate	0.08	(0.0552, 0.1146)	statsmodels 0.14.6

Figure 1: aggregate_orphan_rate – observed value with Wilson 95% CI.
