Empirical Proof Record — VALIDATED

Proof ID: 77c1f925244a3490887366d80bd78b9d...

Created: 2026-05-23T21:01:11.725624+00:00

1. Claim

At least 80% of Kimera's always-on numeric signals carry real dynamics across a DIVERSE stimulus battery (a signal frozen across every corpus — multilingual, financial, code, adversarial — is a genuine dead wire, not merely an unexercised conditional organ).

- **Operationalisation:** Stream 40 records from each of ['flores', 'financial', 'linux', 'cyber'] through the 'entity' target; combine all cycles; of signals present in EVERY cycle, the fraction taking ≥ 2 distinct values across the WHOLE battery. $\text{liveness_rate_union} = \text{always_on_live} / \text{always_on_total}$.
- **Threshold:** $\text{liveness_rate_union} \geq 0.8$ proportion
- **H0:** H0: union liveness $< 80\%$ — genuine dead wires remain (frozen even under their own trigger); worklist non-empty
- **H1:** H1: union liveness $\geq 80\%$ — the always-on surface is dynamically alive under diverse stimuli

2. Verdict

VALIDATED — observed 0.8641304347826086

always-on liveness 0.8641: 477/552 every-cycle signals carry real dynamics; 75 are frozen defaults (the worklist); Wilson 95% CI [0.8330, 0.8902]. Context: whole-surface 4647/22053 (0.2107, deflated by under-sampling); 160 cycles

3. Evidence

Pillar	Statistic	Value	95% CI	Library
signal_dynamics	liveness_rate	0.8641304347826086	(0.8330, 0.8902)	statsmodels 0.14.6
