Empirical Proof Record — **REFUTED**

Proof ID: 442851af8e217b9b56ae723d7d53b5de...

Created: 2026-05-23T20:28:02.507403+00:00

1. Claim

At least 80% of the numeric signals Kimera emits during real-corpus cycles carry real dynamics (vary with the stimulus) rather than emitting a frozen default constant.

- **Operationalisation:** Stream 64 diverse records from the 'flores' corpus through the Kimera 'entity' target; collect every finite numeric leaf in CycleResult.raw across cycles. A signal is LIVE if it takes ≥ 2 distinct values across the cycles it appears in, FROZEN if constant. $\text{liveness_rate} = \text{n_live} / \text{n_numeric_signals_total}$.
- **Threshold:** $\text{liveness_rate} \geq 0.8$ proportion
- **H0:** H0: $\text{liveness} < 80\%$ — most emitted signals are frozen defaults; the body is structurally wired but not dynamically alive; the frozen worklist is non-empty
- **H1:** H1: $\text{liveness} \geq 80\%$ — the emitted signal surface is dynamically alive

2. Verdict

REFUTED — observed 0.20997841817950996

3308/15754 numeric signals carry real dynamics (liveness 0.2100); always-on liveness 0.6728 (551/819); 12446 frozen; Wilson 95% CI [0.2037, 0.2164]; 64 cycles

3. Evidence

Pillar	Statistic	Value	95% CI	Library
signal_dynamics	liveness_rate	0.20997841817950996	(0.2037, 0.2164)	statsmodels 0.14.6

Figure 1: liveness_rate – observed value with Wilson 95% CI.
